

**I. COURSE DESCRIPTION:**

This course applies concepts learned in HMI 202 to home heating, air conditioning and ventilation systems. We will be using air conditioning and refrigeration principles to help with the home inspector's role in defect recognition when examining a home's HVAC system. Students will also become familiar with types of heat pumps as well as their functions.

**II. LEARNING OUTCOMES AND ELEMENTS OF THE PERFORMANCE:**

Upon successful completion of this course, the student will demonstrate the ability to:

**1. *Demonstrate safe work practices as they relate to the air conditioning system and be able to identify these hazards.*****Potential Elements of the Performance**

- Understand the hazards and know the safety precautions to be used when handling refrigerants
- State the shop safety rules
- Discuss refrigerant recovery techniques
- Discuss how to safely use hand and power tools
- Name electrical hazards and discuss electrical safety rules
- Identify the physical and chemical hazards of an air conditioning system
- List types of refrigerant leak detection
- Describe MSDS's including content along with the WHMIS regulations

**2. *Understand the benefits that can be achieved through proper maintenance of HVAC equipment.*****Potential Elements of the Performance:**

- In the shop setting, measure and record the entering and leaving dry bulb temperatures
- Explain the fundamental principles of Psychrometrics
- List the reasons for evacuating a refrigeration system
- Describe the pressure-temperature relationship of saturated refrigerant
- Describe the fundamental principles of heat transfer as they apply to the water-cooled condensers, cooling towers, and evaporative condensers
- Identify the four major components of the air conditioning system and explain their operating functions.
- Describe how to safely and properly perform preventative maintenance on the air conditioning system.

- Discuss the importance of replacing the air filter on a regular basis

**3. *Demonstrate the ability to safely use selected tools, meters, and refrigeration equipment.***

Potential Elements of the Performance:

- Identify the major tools used in HVAC/R work
- List the different types of electrical meters and explain how they are used
- Explain the relationship of voltage, current, and resistance in an electrical circuit
- Recognize the importance of properly sized wire for varying load requirements
- Distinguish the difference between the high side and low side of an air conditioning system
- In a lab setting, demonstrate the safe use of electrical meters and refrigeration gauges
- Understand the benefits of having a programmable thermostat control the air conditioning system.

**4. *Recognize the principles of operation of an air conditioning system.***

Potential Elements of the Performance:

- Explain the fundamental principles of the refrigeration cycle
- Perform practical assignments in the lab environment and be able to put recognize and analyze the data
- Use examples when describing the three basic methods of heat transfer
- Discuss the difference between recovered, recycled, and reclaimed refrigerant
- Know how the properties of moist humid air relates to human comfort
- Explain why the suction line requires insulation on it.
- Identify how the first and second laws of thermodynamics apply to the air conditioning system
- Compare sensible heat to latent heat

5. ***Distinguish between the different types/styles of air conditioning systems.***

Potential Elements of the Performance:

- Explain the operation of a ductless split air conditioning unit
- Describe the cooling and dehumidification process
- Compare the operation between an air cooled and water cooled condenser
- Understand the operation of fluid pressure in circulating pumps as they apply to geothermal operations
- State how a heat pump works
- Explain the operating function of the major components of an air conditioning system and heat pump system including: compressor, reversing valves, expansion valve, condenser coil and evaporator coils
- Understand that the efficiency of a system can change, depending on the physical size of a component

6. ***Explain how the ventilation system affects air distribution in air conditioning system.***

Potential Elements of the Performance:

- Understand how airflow and air quantity are affected by fitting losses of the duct systems
- Be able to explain the effect of the equipment selection and operation will have on the humidity level of the air
- Explain the purpose of the condensate trap on the drain line from an air conditioning evaporator
- Explain the differences between static pressure and velocity pressure
- Recognize signs of poor airflow across a furnace or air conditioning system
- Interpret between the different styles of fans and explain their applications
- Comprehend the design considerations for locating duct runs
- Understand the benefits of proper thermostat location placement can have on a system

7. ***Identify the differences between Ground-Source, Air to Air, and Geothermal Heat Pumps***

Potential Elements of Performance:

- Understand the operation of the heat pumps components
- Describe the applications best suited for air source and water source heat pumps
- Understand the considerations for sizing the water loop circulating pump.

- List the types of water loops for water source heat pumps
- Understand the characteristics of refrigerant as it flows through the air conditioning components in the heating and cooling modes
- Describe what happens to the refrigerant in the evaporator coil and condenser coil
- Explain how a geothermal system works
- Understand the environment that is necessary for an air conditioning unit and furnace to function properly

### III. TOPICS:

1. Protect yourself and others using safe work practices
2. Principles of heat transfer
3. Electrical meters and troubleshooting
4. Understand how thermodynamic principles relate to heat transfer
5. Types of HVAC equipment
6. Ventilation requirements for an HVAC system
7. Refrigeration and heating cycle troubleshooting guides

### IV. REQUIRED RESOURCES/TEXTS/MATERIALS:

-Fundamentals of HVAC/R, Carter Stanfield and David Skaves; I Prentice Hall ISBN-10: 0-13-222367-8 | ISBN-13: 978-0-13-222367-6

-Handouts specific to course topics

### V. EVALUATION PROCESS/GRADING SYSTEM:

Attendance	5%
Participation	10%
Theory test #1	15%
Theory test #2	15%
Theory test #3	15%
Practical project #1	20%
Practical project #2	<u>20%</u>
	100%

Unexcused late assignments reduces grade by three marks per day.

The following semester grades will be assigned to students:

<b>Grade</b>	<b><u>Definition</u></b>	<i>Grade Point Equivalent</i>
A+	90 – 100%	
A	80 – 89%	4.00
B	70 - 79%	3.00
C	60 - 69%	2.00
D	50 – 59%	1.00
F (Fail)	49% and below	0.00
CR (Credit)	Credit for diploma requirements has been awarded.	
S	Satisfactory achievement in field /clinical placement or non-graded subject area.	
U	Unsatisfactory achievement in field/clinical placement or non-graded subject area.	
X	A temporary grade limited to situations with extenuating circumstances giving a student additional time to complete the requirements for a course.	
NR	Grade not reported to Registrar's office.	
W	Student has withdrawn from the course without academic penalty.	

## **VI. SPECIAL NOTES:**

### Attendance:

Sault College is committed to student success. There is a direct correlation between academic performance and class attendance; therefore, for the benefit of all its constituents, all students are encouraged to attend all of their scheduled learning and evaluation sessions. This implies arriving on time and remaining for the duration of the scheduled session.

## **VII. COURSE OUTLINE ADDENDUM:**

The provisions contained in the addendum located on the portal form part of this course outline.

# HMI 214

# HVAC

Week	Outcomes	Format	Hrs	Topic/Content	Readings	Assignment	Assessment	Resources
1	1,3	Lecture	3	<p><b><u>Protect self and others:</u></b>  <u>Follow</u> shop safety rules and understand how practicing good housekeeping at all times prevents accidents  <u>Explain</u> hazards associated with the different types of cooling systems.  <u>Comprehend</u> the safety procedures and Personal Protective Equipment associated with the HVAC industry.  <u>Identify</u> information on a Material Safety Data Sheet  <u>Describe</u> the four classifications of fire extinguishers  <u>Identify</u> unsafe situations and conditions.  <u>Understand</u> the fundamentals of the heating and cooling systems, as well as, recognize the environmental protection process of refrigerant recovery systems</p>	Units 3, 23, 26	End of chapter questions		Calculators, green tag safety boots, safety glasses Text book <b><i>Fundamentals of HVAC/R</i></b>  Instructor handouts / training materials
2	1, 2	Lecture	1.5	<p><b><u>Principles of Heat transfer and the effects these have on a heating or cooling system:</u></b>  <u>Understand</u> the principles of conduction, radiation, convection, and evaporation.  <u>Explain</u> these principles and relate them to the condition of heating and cooling equipment.  <u>Identify</u>, through observation and temperature readings, when equipment is functioning properly.</p>	Section 2		Formative	As above
		Lab	1.5	<p><u>Take readings</u> at strategic locations in the functioning cooling system and document findings for analysis  <u>Understand</u> the differences between latent and sensible heat as applied to a cooling system and identify and calculate these values.</p>	Units 4-8	Outline: Project - practical assignment #1	Observation of students in lab	

HMI214 – HVAC

				Take amperage readings of a motor load safely State the reasons why 208V appliances run at lower amperages than 110V appliances <u>Identify</u> wiring alterations that may have been made to equipment.				
6	4		3	<b>Field trip</b> <b>Location to be determined</b>			Field trip	As above
7	4	Lecture	1	<b>Review and discuss the field trip.</b> <b>Understand the operation of an evaporator, condenser, compressor, and metering device.</b> Take temperatures at various points along the piping of the air conditioner and explain what is happening to the physical state of the refrigerant. <u>Explain</u> thermodynamic terminology such as: British Thermal Unit, Joule and Watt. Become familiar with terminology related to the First and Second Laws of Thermodynamics. <u>Describe</u> what occurs during the latent heat of fusion and latent heat of vaporization.	Section 2 Units 17-22		Observation of students in lab	As above
		Lab	2	Lab - study the role that airflow and filter maintenance have on heating or cooling operations. Locate the high and low sides of an air conditioning system Perform temperature readings at various locations to identify deficiencies.			End of chapter questions	
8	4, 5	Lecture	1	<b>Explain the basic heat transfer principles of operation for the various heating and cooling sources.</b> <u>Identify</u> various energy sources and explain their operations with confidence.			Observation of students in lab  Formative assessment	As above

HMI214 – HVAC

		Lab	2	<p><u>Understand</u> the refrigeration principles and heat transfer concepts and use those ideas to describe one particular system to their client</p> <p><u>Describe</u> and determine if unacceptable alterations have been made between the size of the duct system and the BTU capacity of the piece of equipment, including supply plenum of furnaces, return air drops and branch runs.</p> <p><b>Lab</b> assignment: <u>Outline</u> the pros and cons for each application explained in week 10, explaining answers.</p>	Section 4, 5  Unit 23, 27	Lab assignment		
9	4, 5, 6	Lab	3	<p><b><i>Explain the basic principles of operation for air conditioning system components.</i></b></p> <p><u>Understand</u> how a ductless split air conditioning system works</p> <p><u>Review</u> the differences between recovered, recycled, and reclaimed refrigerant</p> <p><u>Explain</u> the concept called entropy, enthalpy and practice using a psychometric chart.</p> <p><b><i>Lab -work continued:</i></b> perform a variety of procedures to the equipment and understand what the results of the tests indicate.</p>	Section 4, 5 Unit 18  Instructor handouts	Practical Assignment 2 given	Observation of students in lab	As above
10			3	<b><i>Test #2 - 3 hours</i></b>		Theory Test # 2	Summative	As above

HMI214 – HVAC

12	6	Lecture Lab	3	<p><b><i>Describe the duties of a ventilation system and explain the primary function.</i></b>  <u>Realize</u> the variables that determine the size of a duct run and difference between static and velocity pressure of air  <u>Understand</u> the purpose of a condensate trap on an evaporator.  <u>Know</u> where to properly locate a thermostat  <u>Become</u> familiar with the different kinds of ventilation fans                      state the concepts of how an HRV operates</p>	Section 7  Unit 66-69  Instructor Handouts		Observation of students in lab   End of chapter questions	As above  Instructor handouts
13	6, 7	Lecture Lab	3	<p><b><i>Identify the differences between Ground Source, air to air, and geo-thermal heat pumps</i></b>  <u>Understand</u> what the main components of heat pump systems are and be able to explain the operations  <u>Identify</u> the roll a circulating pump serves in a geo-thermal heat pump  <u>Describe</u> the main differences between styles of heat pumps.  <u>State</u> the importance of a circulating pump                      Work on completing assignment #2 in the lab                       Review materials for upcoming test</p>	Section 6 Unit 49-53		Observation  End of chapter questions	As above
14		Test #3	3	Theory Test #3 - 3 hrs			Summative	Pencils, calculator, eraser
15	1-7	Lecture Lab	3	Review highlights from previous Learning Outcomes	Instructor Handouts			
16		Lecture	3	Question and answer session Class to evaluate my instruction by completing an evaluation Debrief of the semester			Formative
