BUILDING SCIENCE III

PHY 226

THIRD SEMESTER

TEXTS:

- 1. Mechanical & Electrical Design of Buildings Merritt McGraw-Hill Publishers
- 2. The Trane Heating Manual Trane Company Canada Ltd.
- 3. Residential System Design Manual for Air Heating & Cooling Systems HRA Institute of Canada
- 4. Westinghouse Design Handbook

REFERENCE TEXTS:

- 2. Acoustics in Modern Practice Fritz Ingerslev
 Architectural Press
- 3. Design of Good Acoustics J. E. Moore Architectural Press
- 4. Practical Electricity McPartland & Novak McGraw-Hill
- 5. Design for Noise Reduction J. E, Moore Architectural Press
- 6. Lighting in Architectural Design Derek Phillips McGraw-Hill
- 7- Piping Handbook Sabin Crocicer McGraw-Hill Book Co.
- 8. Plumbing Harold E. Babbitt McGraw-Hill
- 9. Fundamentals of Pipe Drafting Charles H. Thompson John Wiley & Sons
- 10. Metric Practice Guide H.R.A,
- 11. Applied Solar Energy Addison Wesley
- 12. National Research Council Solar Publications & Reports
- 13. Part G of the Ontario Building Code

PHY 226

Heating installations design and layout, types of heating systems, heat loss calculations, components and operations of different heating systems such as hydronic, forced air and electric heating.

Topic Information

Introduction and Hydronic Heating Design

Part 1

terminology base temperature types of heating systems heat loss calculation infiltration exposure calculation of "U"- Factor for a composite wall hotwater heating design conductivity and resistance of various materials use of multipliers to construct the radiation sheet selection of proper radiation types of boilers and selection types of hotwater heating systems layout of a heating system gallonage temperature drop and head calculations pipe sizing Partompone Forsedf Warmo A wat Heah enging system

introduction purpose and scope specifications general design recommendations equipment selection supply outlet selection and location return air intake selection and location symbols layout procedure supply branch and outlet sizing return branch and inlet sizing supply and return trunk duct sizing sample register and diffuser tables equivalent lengths of fittings and intakes charts and tables sample layout and work sheets requirements for duct in slab systems specifications for forced warm air heating as applied to existing homes

Part 3 - Electric Heating

- a) Terminology
- b) Conponents
- c) Design and Layout
- d) Advantages & Disadvantages

Part 4 - Plumbing Installations

- a) Terminology
- b) Residential requirements
- c) Hot and cold water supply
- d) Waste pipes and systems
- e) Sewage vent stacks
- f) Storm drainage
- g) Pipe sizes
- h) Components
- i) Practical installations

Performance Objectives for Building Science III

The general objective of this course is to give the Architectural student an insight into heating and mechanical design for buildings. The student will study design procedures for hot water and forced air heating along with their applications. The student will also investigate plumbing regulations and the various types of sanitary and storm systems used in residential and commercial buildings.

The specific objectives follow:

Part 1 - Introduction & Hydronic Heating Design

- 1. To identify the terminology used in hot water heating design.
- 2. To compare the various types of heating systems.
- 3. To review the physics of heat eq: how heat travels, types of heat, etc
- 4. To identify the purpose of any heciting system.
- 5. To review the mechanical and heating symbols used on technical drawings.
- 6. To determine the base temperatures for various localities.
- 7. To determine the U-factors for various wall types, floors and ceilings.
- 8. To solve heat loss problems for specific conditions.
- 9. To construct a radiation sheet.
- 10. To construct a job data sheet.
- 11. To determine the effects on total heat loss due to exposure.
- 12. To determine the effects on total heat loss due to infiltration.
- 13. To solve infiltration problems.
- 14. To develop the air change factor.
- 15. To identify the "K" factor.
- 16. To identify the "C" factor

- 17. To identify the "R" factor.
- 18. To develop the "U" factor for a given wall using the above factors and the proper formulas.
- 19. To calculate the total heat loss for a given residential structure.
- 20. To identify and select a boiler for given design situations.
- 21. To select convector radiation and cast iron radiation.
- 22. To determine temperature drop and g.p.m. requirements.
- 23. To select an expansion tank.
- 24. To identify and select a one pipe hot water heating system.
- 25. To identify and select a two-pipe revers'e return system.
- 26. To identify and select a two-pipe direct return system.
- 27. To identify and select a series loop system.
- 28. To identify and select a one-pipe zoned system.
- 29. To layout to scale and by employing proper graphic symbols the above mentioned piping systems.
- 30. To determine the "milinch" and its use in hot water design.
- 31. To select a hot water circulating pump.
- 32. To determine the required pump head in milinches.
- 33. To size the piping by use of the pipe sizing tables.
- 34. To identify and be able to relate to others the use of the following hot water heating components:
 - a) one pipe fittings
 - b) air vents
 - c) altitude gage
 - d) flow control valve
 - e) pressure relief valve
 - f) make-up water line
 - g) automatic feed valve
 - h) globe value
 - i) air charging value
 - j) balancing valves, etc,
- 35. To identify and relate to others methods of automatically controlling hot water heating systems.
- 36. To identify various types of thermostats that are used for hot water heating control.

NOTE: The main objective of Part 1 of this course is for the student to design a complete hot water heating system for a small residential type building.

Part 2 - Forced Air Heating

- 37. To identify the terminology used in the design of a forced warm air heating system.
- 38. To select the proper warm air furnace.
- 39. To identify the various warm air heating system components such as:
 - a) diffusers
 - b) dampers
 - c) register
 - d) end boots
 - e) supply and return trunks
 - f) zones etc,
- 40. To identify and layout the basic types of warm air heating systems such as:
 - a) loop system
 - b) raciial system
 - c) perimeter system
- 41. To identify and draw the symbols required for warm air and ventilating systems
- 42. To identify the characteristics of the various forced air heating systems.
- 43. To identify the ventilation requirements for various building uses and occupancies.
- 44. To identify static head.
- 45. To determine methods of measurement of air pressure in ducts.
- 46. To identify the manometer tube.
- 47. To determine the function of the manometer tube.
- 48. To design the supply outlets and location for a residential forced air system.
- 49. To determine diffuser locations.
- 50. To design the return inlet sizes and location for a residential forced air system.
- 51. To layout the supply outlets on plan.
- 52. To layout the return outlets on plan.
- 53. To select the furnace size and type.
- 54. To locate furnace on plan.

- 55. To indicate all risers, elbows and fittings on heating plan.
- 56. To design the supply branches.
- 57. To draw the supply branches on plan to scale.
- 58. To measure actual duct length from plan from bonnet of furnace to supply outlet.
- 59. To determine the total equivalent length of all fittings.
- 60. To determine the total equivalent length of the supply and return branches.
- 61. To record the cfm requirements per outlet.
- 62. To determine the supply and return plenum pressures.
- 63. To determine the duct size, round and/or rectangular.
- 64. To determine the outlet sizes and record on plan and data sheets.

Part 3 - Electrical Heating

- 65. To define a degree day.
- 66. To determine the number of watts of electrical power required for a given total heat loss in M,B.H,
- 67. To identify the various types of electrical heating components.
- 68. To design an electrical heating system.
- 69. To layout the system on plan.
- 70. To investigate the costs of the various types of heating systems both for initial installation and for fuel costs.
- 71. To identify the components of a refrigeration system.
- 72. To be able to list the factors which influence air conditioned environments.
- 73. To identify a heat pump.
- 74. To identify the various factors involved in selecting refrigerants.
- 75. To identify the components of a complete year-round air conditioning machine.
- 76. To draw the various elements of the system schenatic.

Part 4 - Plumbing Installations

- 89- To identify the terminology used for sanitary and storm drainage systems.
- 90. To investigate the code regulations governing domestic sanitary drainage systems.
- 91. To draw a schematic showing the components for a building sanitary system,
- 92. To identify the schematic for a hot and cold water supply
- 93. To determine the components required for a sanitary and storm drainage system.
- 94. To layout riser diagrams for sanitary and storm systems to code regulations -
- 95. To identify the fixture units and determine their use in pipe sizing.
